Objective

The main objective of this task was to develop a professional and completely responsive portfolio website that introduces me as a CS graduate and showcase my recent work.

The specific goals were to:

- Present my profile, projects, skills, education and contact information through a clean and attractive interface.
- Create a consistent design and professional color theme all over the website.
- Make the layout responsive using only html5 and css.
- Implement smooth scrolling and hover animations.

Technologies Used

I used the following technologies in my project.

HTML5:

HTML was used to create the structure of the website. I divided the page into sections such as Home, About, Skills, Education, Projects, and Contact so that the content would be easier to navigate.

CSS3:

CSS was used to control the appearance of the website, including colors, spacing, text sizes, borders, buttons, and card layouts. I also used CSS to add hover effects and make the website responsive.

CSS Grid and Flexbox

I used CSS Grid and Flexbox to arrange content in rows and columns. These properties helped me organize the hero section, skill cards, project cards, contact area, and footer.

Media Queries:

Media queries were used to make the website responsive. It makes the layout change at smaller screens.

Font Awesome

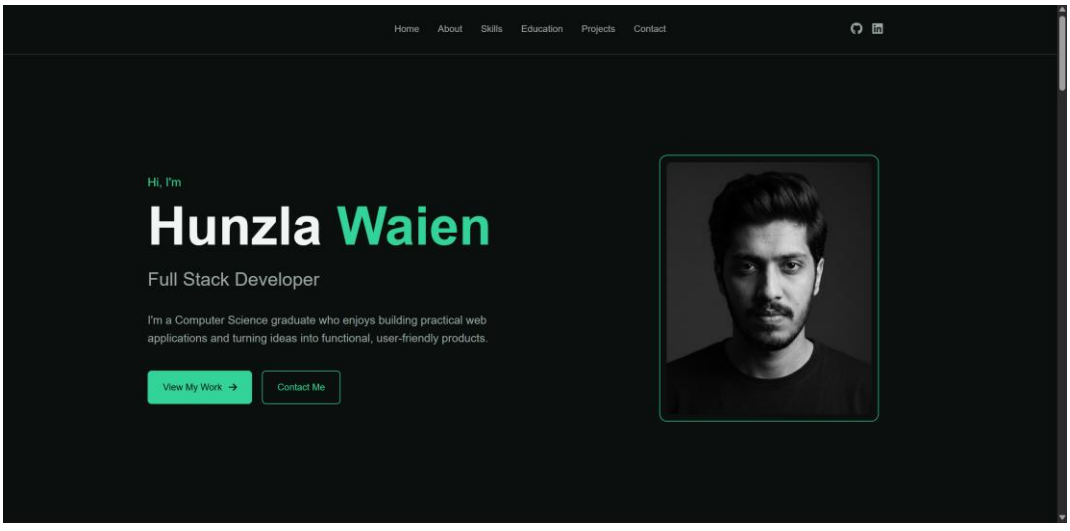

Font Awesome was used to add icons for technologies, social links, and contact information.

Website Structure

The portfolio is designed as a single-page website. Each main section has its own heading and can be reached through the navigation menu.

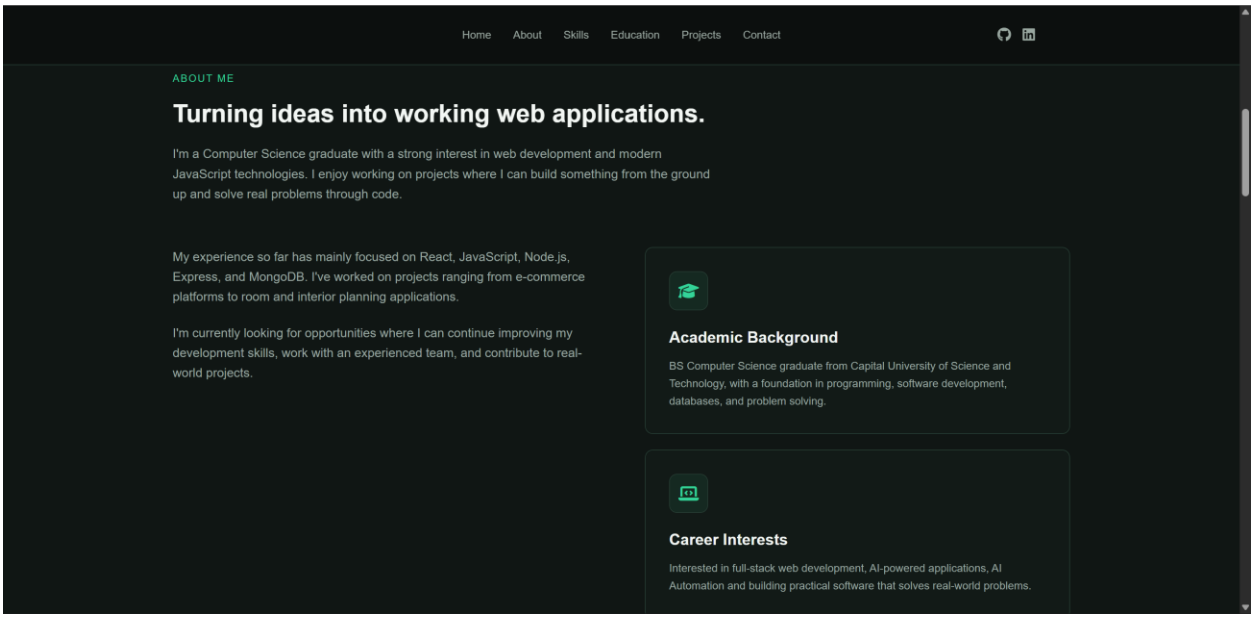

Home Section

The home section includes a short introduction, a profile image, and buttons that direct visitors to the project and contact sections. I kept this section focused on the most important information so visitors can understand the purpose of the website without having to read through the entire page.

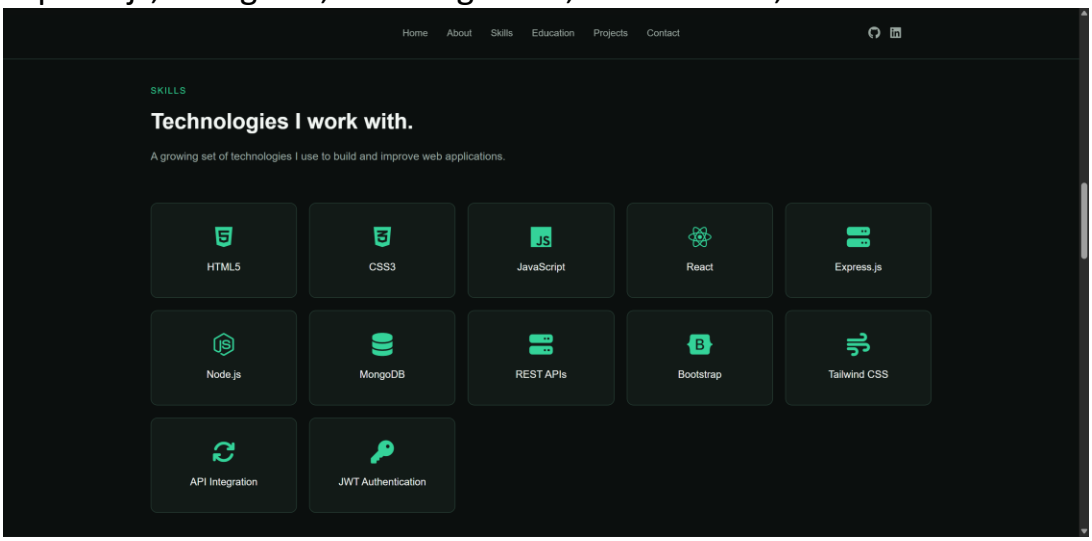

About Section

The About section provides information about my background and interests. It also contains separate cards for my academic background and career interests, keeping this information organized rather than placing everything in one long paragraph.

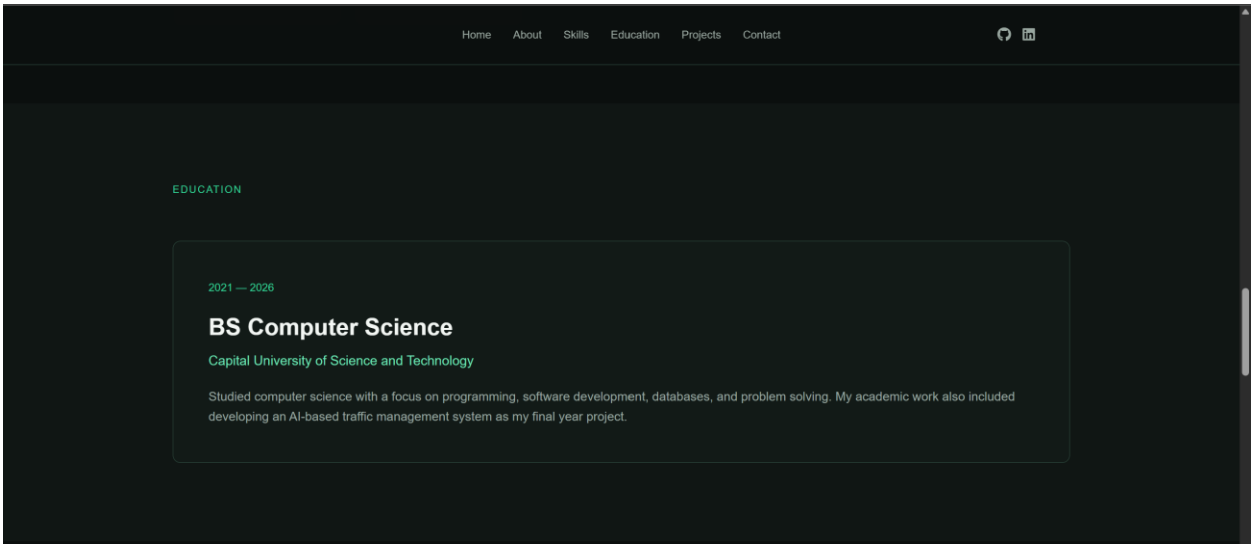

Skills Section

The Skills section presents the technologies and development tools I have worked with. The skills displayed include HTML5, CSS3, JavaScript, React, Node.js, Express.js, MongoDB, API Integration, Tailwind CSS, and REST APIs.

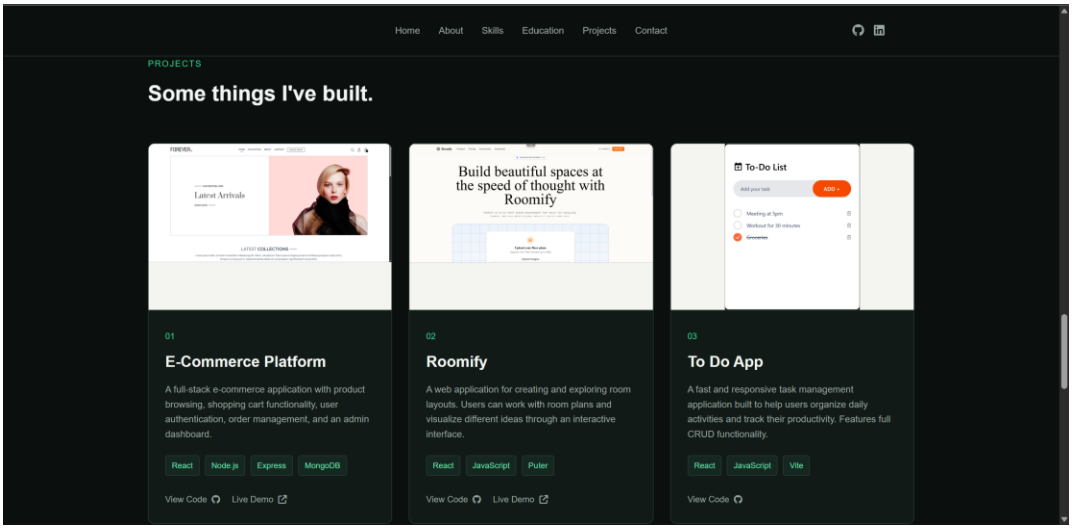

Education Section

I chose a text-based card design for this section rather than using a photograph of the university. This keeps the focus on the degree and the information relevant to my education. The Education section presents my BS Computer Science degree from Capital University of Science and Technology (CUST), Islamabad, and a brief description of my academic background.

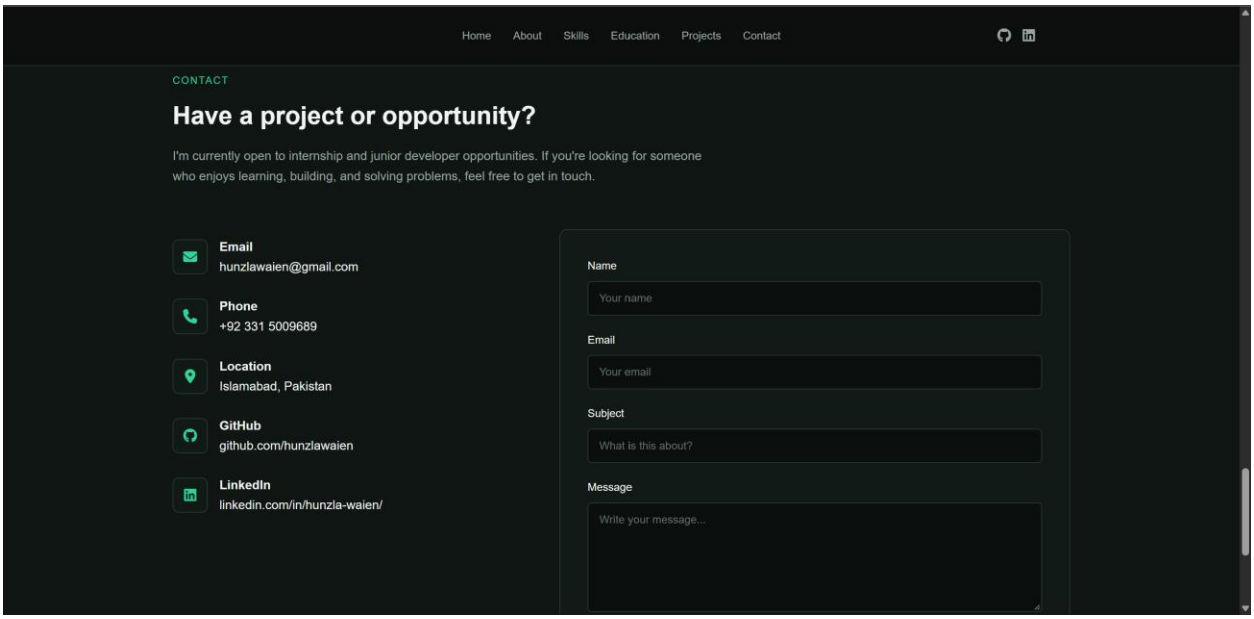

Project Section

The Projects section highlights three projects and gives a brief idea of what each application does. Each card includes a project title, description, technology labels, and project links.

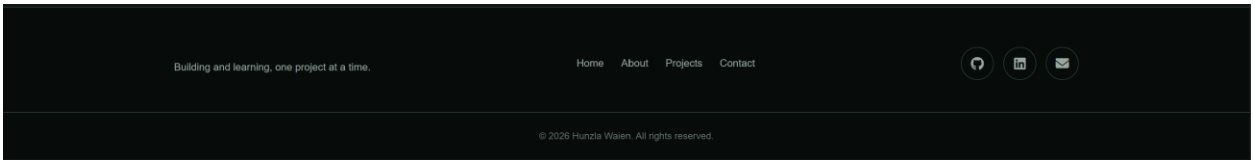

Contact Section

The Contact section provides a way for visitors to find my contact information. It includes fields for a name, email address, subject, and message. The form doesn't have any backend or form-handling service for now.

Footer

The footer appears at the bottom of the page. It contains quick navigation links, social media icons, and a copyright notice.

Design and Layout

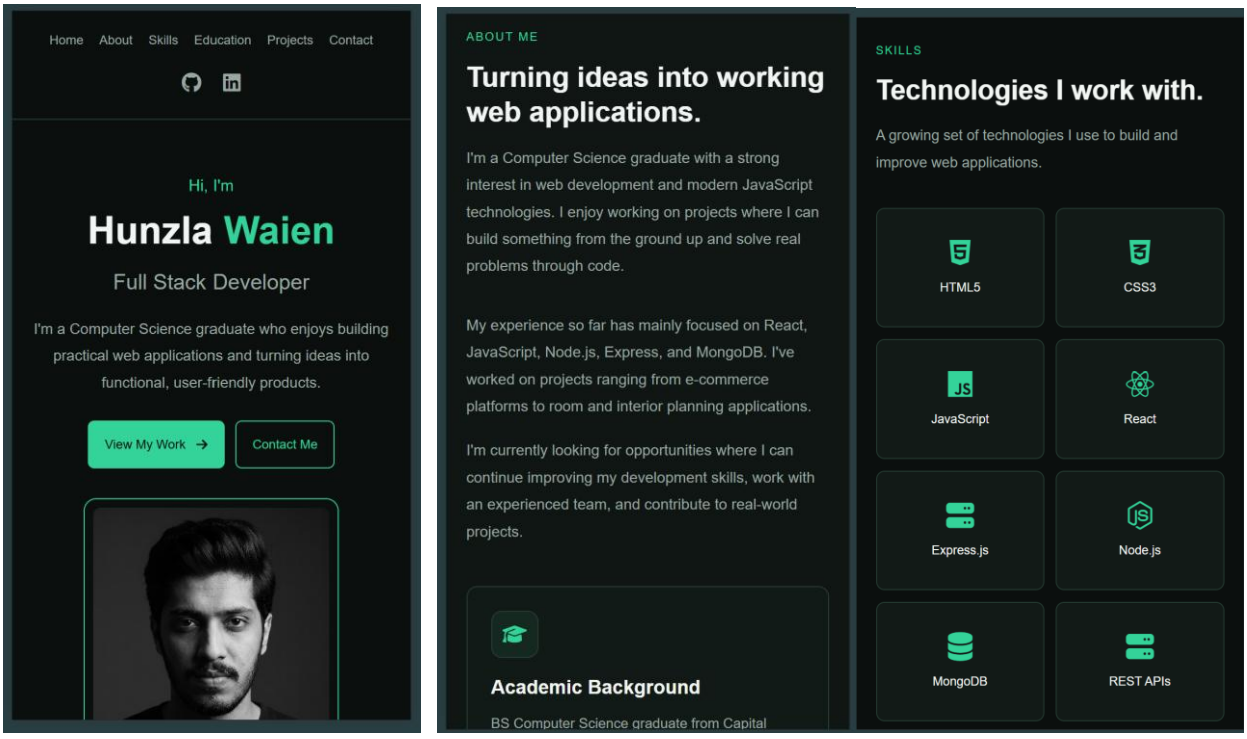

For the design, I chose a charcoal background with emerald-green accents. I wanted to avoid a bright, crowded layout and give the website a consistent appearance.

The charcoal color is used for the main background, while slightly lighter shades distinguish cards and other content areas. Emerald green is used for buttons, icons, selected headings, borders, and technology labels.

I reused these colors throughout the page instead of giving every section a different style. This helps the portfolio feel connected from the navigation bar to the footer. I also used borders, spacing, and small hover effects to distinguish individual cards.

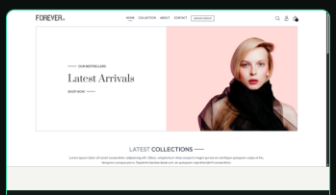

Responsive Design

The responsive rules adjust elements such as the navigation menu, hero section, skills grid, project cards, education card, contact form, and footer. I used media queries for this design. For smaller screens, the design is intended to reduce the number of columns and stack content vertically where necessary.

PROJECTS

Some things I've built.

01

E-Commerce Platform

A full-stack e-commerce application with product browsing, shopping cart functionality, user authentication, order management, and an admin dashboard.

React | Node.js | Express | MongoDB

View Code | Live Demo

EDUCATION

2021 — 2026

BS Computer Science

Capital University of Science and Technology

Studied computer science with a focus on programming, software development, databases, and problem solving. My academic work also included developing an AI-based traffic management system as my final year project.

opportunity?

I'm currently open to internship and junior developer opportunities. If you're looking for someone who enjoys learning, building, and solving problems, feel free to get in touch.

Project Files and Repository

The project uses separate HTML and CSS files. Keeping the structure and styling separate makes the code easier to read and update. It also includes the images used in the website a README file and pdf report.

Conclusion

This task gave me an opportunity to practice building a complete webpage using HTML and CSS. Rather than focusing on a single component, I had to think about how several sections would work together and how a visitor would move through the website.

I worked on organizing the content, maintaining a consistent color scheme, presenting my projects, and adding responsive rules for smaller screens.

Overall, the portfolio provides a starting point for presenting my work and development experience.
